MWD LOGGING

Capture data in real-time, access on-demand via the web. GRT's specialized online data monitoring system is key component in maintaining situational awareness during drilling operations.

Global Remote Technologies offers measurement while digging logging services as part of the integral online data monitoring system. The remote directional system captures the MWD data and brings it online, where it can be viewed through a dashboard service.

Remote users can operate the system with their laptops or smartphones. GRT also provides rugged laptops systems with software already installed. These systems include a serial port interface and a hard, airtight, rugged carrying case.

The MWD logging system completes the WITSML solution as the built in WITSML data push provides complete synchronization with up to four WITSML storage servers. The logging systems contain all of the standard functions required and adds several unique features such as a built-in contact and email manager for sending out reports and plots and are compatible with all major brand MWD pulse decoders and all WITS based rig monitoring systems.
